What is UX/UI Audit?

A UX/UI audit is like a check-up for digital products, such as websites or apps. It helps find any problems that make it hard for people to use them. This review looks at how easy it is for users to navigate and understand the product, if it looks consistent, and if it follows best practices.

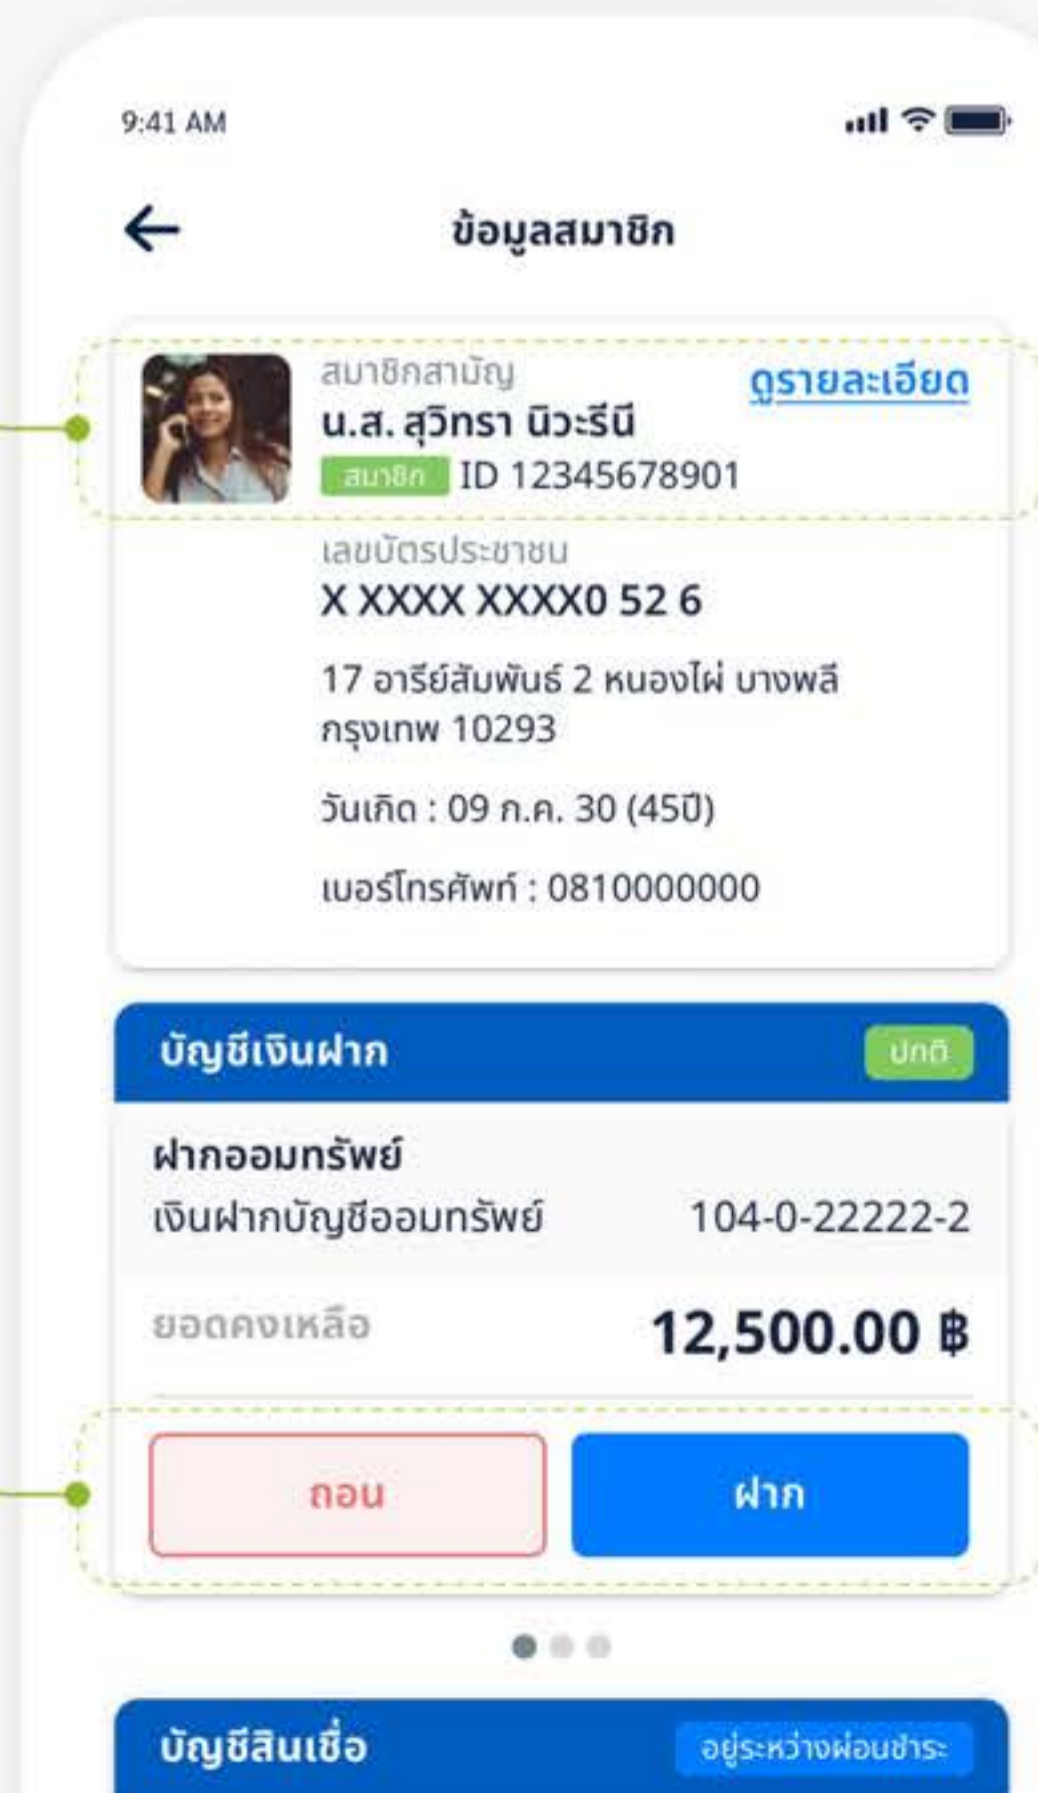

The goal is to make sure the product works well for everyone and meets their needs. After the audit, you get a report with suggestions to fix any issues found. Making these fixes can make users happier and more engaged with the product, leading to better results overall.

1

There's an avatar for the user, which personalizes the experience. However, the purpose of other icons should be made clear – if they're interactive, it should be obvious to the user.

2

The page has a clear call-to-action with its button design, showing strong contrast against the background which makes them stand out. The input fields are well-defined, and the red outline indicates a required or attention-needed field, although red can sometimes indicate an error, so this might be confusing.
